Cancer Immunotherapy: Chapter 6. Mucosal Immunity Cathryn Nagler, Taylor Feehley

Mucosal surfaces form the interface of the body with the external environment and play a central role in immune surveillance and protection against infection. The surface areas that comprise the mucosa are defined by the presence of a semipermeable epithelial barrier that is reinforced by a variety of innate and adaptive immune mechanisms. Large numbers of lymphocytes that reside below the epithelium serve to protect against microbial invasion and mediate immunity to disease. Mucosal surfaces are also the home of the commensal microbiome, a diverse community of bacteria that contributes to the health of the host but must also be contained and controlled by the immune system at these sites. Overall, mucosal surfaces provide an essential barrier between the host and the outside environment and are characterized by the novel adaptations required to protect this barrier.
