Cognitive Science and Genetic Epistemology: A Case Study of Understanding (Path in Psychology)

David Leiser, Christiane Gillieron

Some 10 years ago, Leo Apostel presented an analysis of developments taking place in genetic epistemology and artificial intelligence, and remarked that the two disciplines appeared to be converging, without one dominating or assimilating the other. In his view, significant formal and experimental progress would be required in the post-Piagetian era: genetic epistemology would need to take into account developments in artificial intelligence, while remaining an independent discipline at the frontiers of biology, logic, and psychology. The work of David Leiser and Christiane Gillieron, both psychologists with a Genevan training who are concerned by the procedural aspects of intelligence, is an important contribution. Their studies, which open up new theoretical perspectives, are carried out with meticulous attention to research methodology. Going beyond merely addressing criticisms about the status of Piagetian operational structures, their work will help fill the gap between genetic epistemology and cognitive science.
